Table 1: Agreement of fixed-method performance patterns between sampling designs. Pearson correlations compare the six prespecified method means; sign agreement compares each prespecified paired contrast. Results are descriptive and do not identify a causal effect of sampling design.

Learner, CS and RN columns indicate whether the respective contrast has the same sign in both designs. Values within 10^{-12} percentage points of zero are numerical ties; two zero signs agree. CSV files retain the signed contrasts. Each method mean uses 20 splits; the comparison unit for this diagnostic is the six fixed configurations, not independent datasets.
